

On the Classification of Reasoning Outputs

A structural resolution

Reasoning outputs operating on analysis, aggregation, and synthesis constitute a distinct class of communication. Their function is the production of structural resolution, not social interaction.

The majority of public exchanges, including within technical or strategic contexts, do not operate within this class. They fulfill expressive, relational, positional, or performative functions and are not optimized for analytical resolution.

Under these conditions, evaluating reasoning outputs through the identity, intention, or perceived position of a presumed speaker constitutes a category error.

Contemporary analytical syntheses increasingly emerge from aggregated processes involving multiple agents, shared theoretical frameworks, and artificial augmentation systems drawing on common cross-domain knowledge bases.

As a result, attribution to individual messengers becomes secondary to the structural properties, internal coherence, and logical validity of the reasoning itself.
